### Q1: Who is our CTO and if I want to visit his office, are my commute costs reimbursable?

There were two questions related to the docs in this question. The expectation was for the agent to look up the CTO's name in the docs (org-chart.md). It ended up looking for the CTO's name in the emails, which obviously, could not find any relevant emails. It did not attempt to search the docs at all and gave up. The model also could have asked me a clarifying question regarding mine or the CTO's office location, but it didn't. It was however able to retrieve the commute reimbursement policy, but it assumed I was asking about commuting to my home office. I updated the system prompt with 3 new rules (10, 11, 12) and it was able to find the CTO, but still considered his office might not be the same as my assigned office. Bonus is that it reported a prompt injection to my attention. *chat-20261031-204621.json, chat-20261031-213102.json*

### Q2: Did Zarin Imam (job seeker) ever get a response from Enron?

The agent was able to search and find all (4) relevant emails. The agent did mention it was not able to determine from the email alone whether anyone replied. However, it did not open any of the other emails found. If it did, it would have realized that Zarin did manage to shadow a job opportunity and was actually an internal employee looking for a new role. I probably can update my system prompt to tell the agent to open up all email search results for more context. After adding rule 11 in the system prompt, it still was passing on important emails from the relevant person, so I updated rule 11 to read all relevant emails. The agent successfully read all email results for the utmost context and was correct that the emails don't show a reply to Zarin about the job, along with several other observations. A bonus here was that it automatically asked me for approval to run a python script to scan the whole archive for zarin.imam to make sure the BM25 index didn't miss it. *Chat-20261031-204621.json, chat-20261031-213102.json, chat-20261031-215051.json, chat-20261031-215429.json*

### Q3: Count the number of emails that were sent to/from addresses from arthurandersen.com?

The agent answered with an incorrect answer of 4. The correct count is 14. The commands it ran required the domain to be exactly artherandersen.com, but skipped any subdomains such as us.arthurandersen.com. I would consider being more specific about email domains. *Chat-20261031-215836.json*

### Q4: Give me the email digest

The agent did well here. The agent asked for the date before acting, then produced the digest of ~340 emails. There was a questionable judgement on what is urgent, as it labeled a Mendocino bike ride as such. This can probably be tuned by updating the priority rubric MD file instead. *chat-20261031-220643.json*

### Q5: Find every place the company mentions VaultKey and tell me what each one says.

The agent performed well here. It was able to identify the 3 documents containing "VaultKey". However, after I denied it from grepping *emails.jsonl*, it did not mention it at all, instead it confidently stated "no matching emails". I could ask it to be honest in the tool denial message or in the system prompt. *chat-20261031-221544.json*
